

API

We support three different ways you can extend and automate your use of dRofus:

Admin system REST API

This allows you to automate task related to creation and managing your projects. E.g. create new project, add/remove users etc.

Database REST API (new)

This allows you to connect directly to your database/project and automate tasks and/or extract data to create your own reports/dashboard.

dRofus Embedded Property Pane

This allows you to add a live "window" into your dRofus data from another application. We handle everything with formatting and presentation and your integration only have to tell e.g. "Show properties for room X" based on a shared key (id, room number or other).
